

 DEPLOY • WEB DASHBOARD

Put your app on the internet.

A simple, step-by-step guide. Sixteen small steps, each with a picture. At the end you get a link anyone can open.

You only need two things.

Everything happens in your browser. No cloud account. No setup on your computer.

■ **A way to sign in.** Google, GitHub, or your email. That becomes your zop.dev account.

■ **Your app's code on GitHub.** A public or private repo. It does not need a Dockerfile. ZopDay figures your app out on its own.

THE PLAN

PART 01 Sign in Open zop.dev and log in.	PART 02 Make a project Give it a name. That's it.	PART 03 Add your code Point ZopDay at your GitHub repo.	PART 04 Go live Press Deploy. Get your link.
--	---	---	--

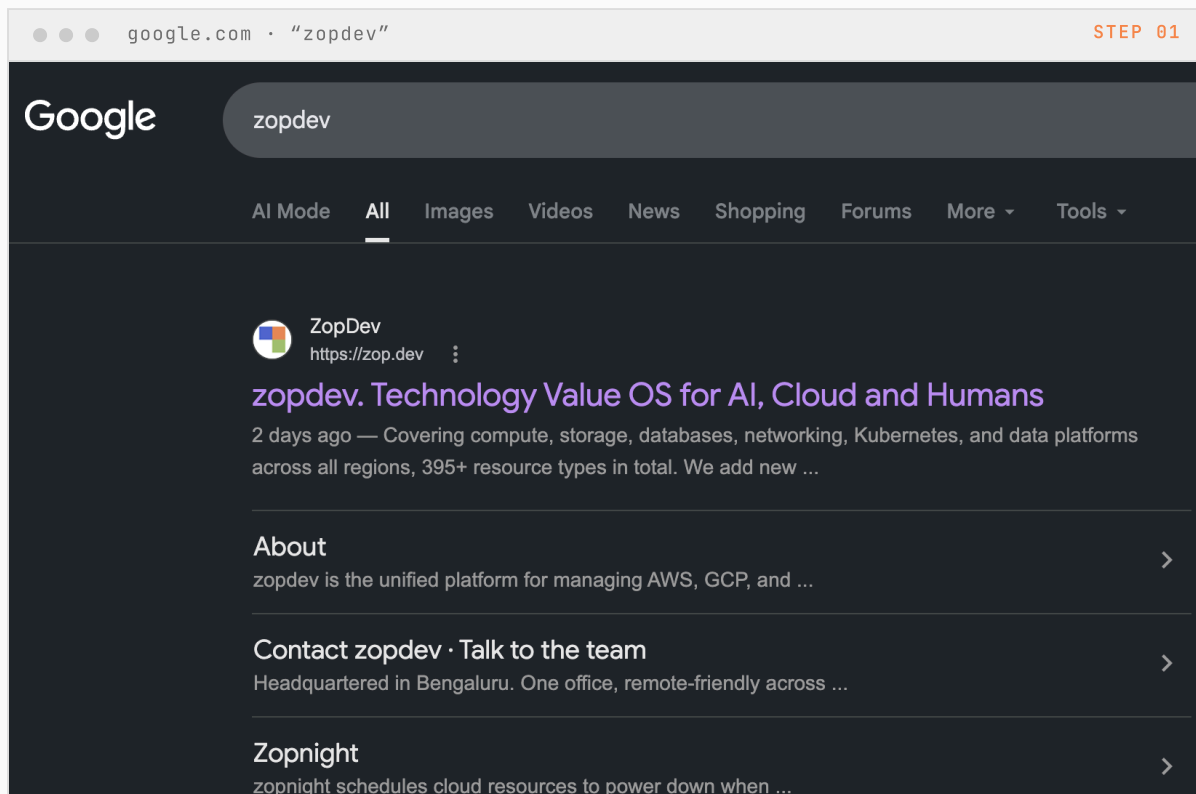

How long does it take?

About ten minutes of clicking, then a few minutes of waiting while ZopDay builds your app.

01

Open zop.dev

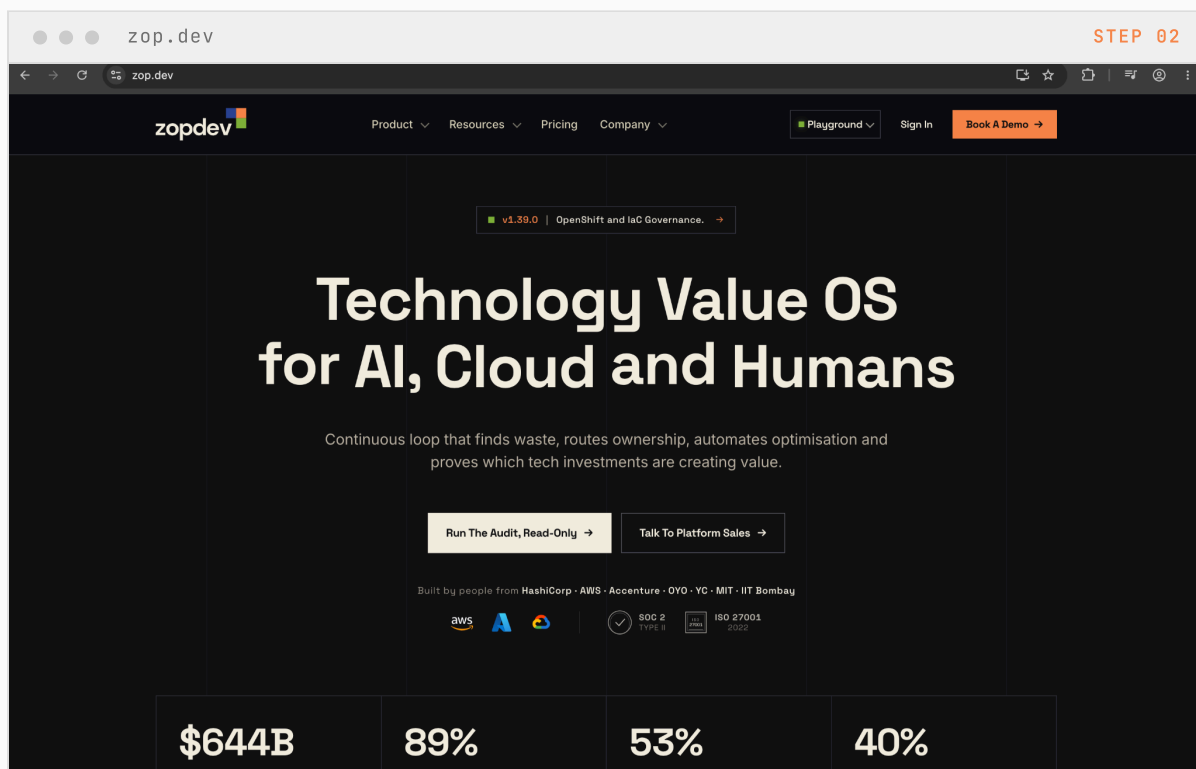

Type `zop.dev` in your browser. Or search for **zopdev** and click the first result.

02

Click Sign In

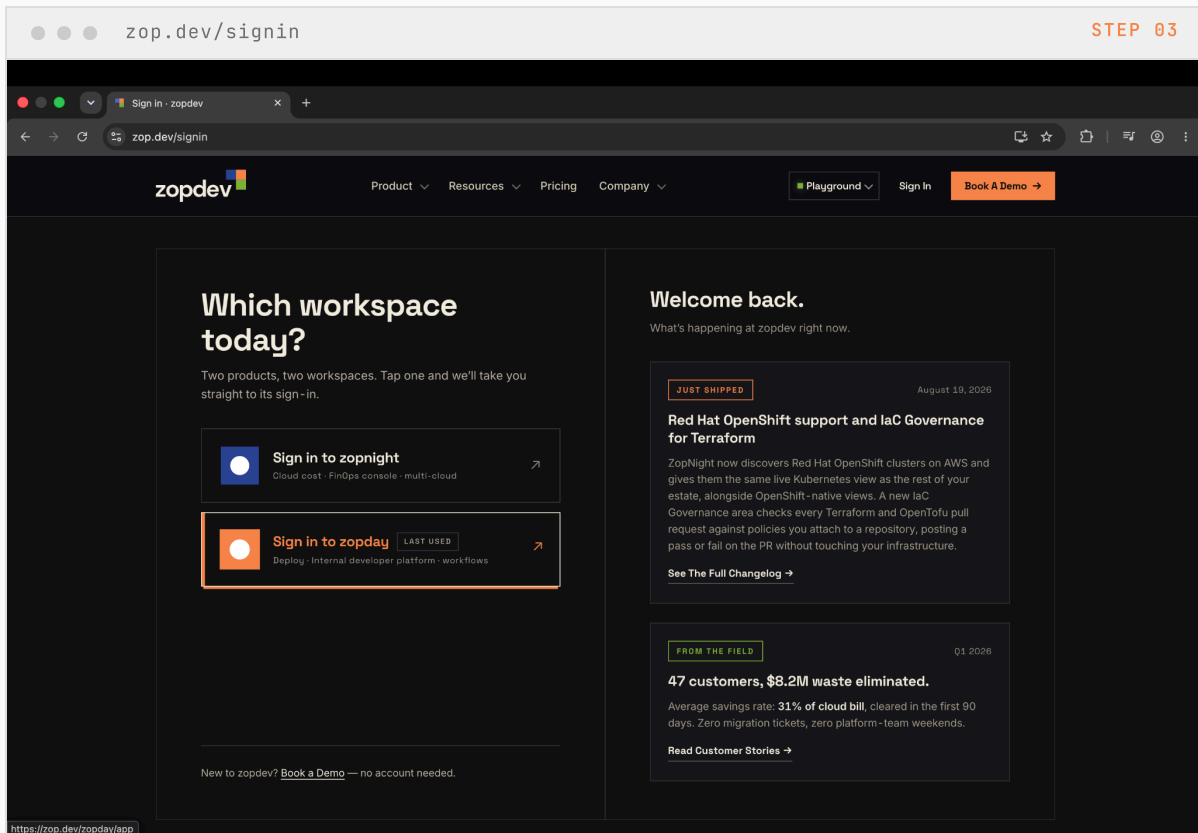

It is in the top right corner.

03

Choose “Sign in to zopday”

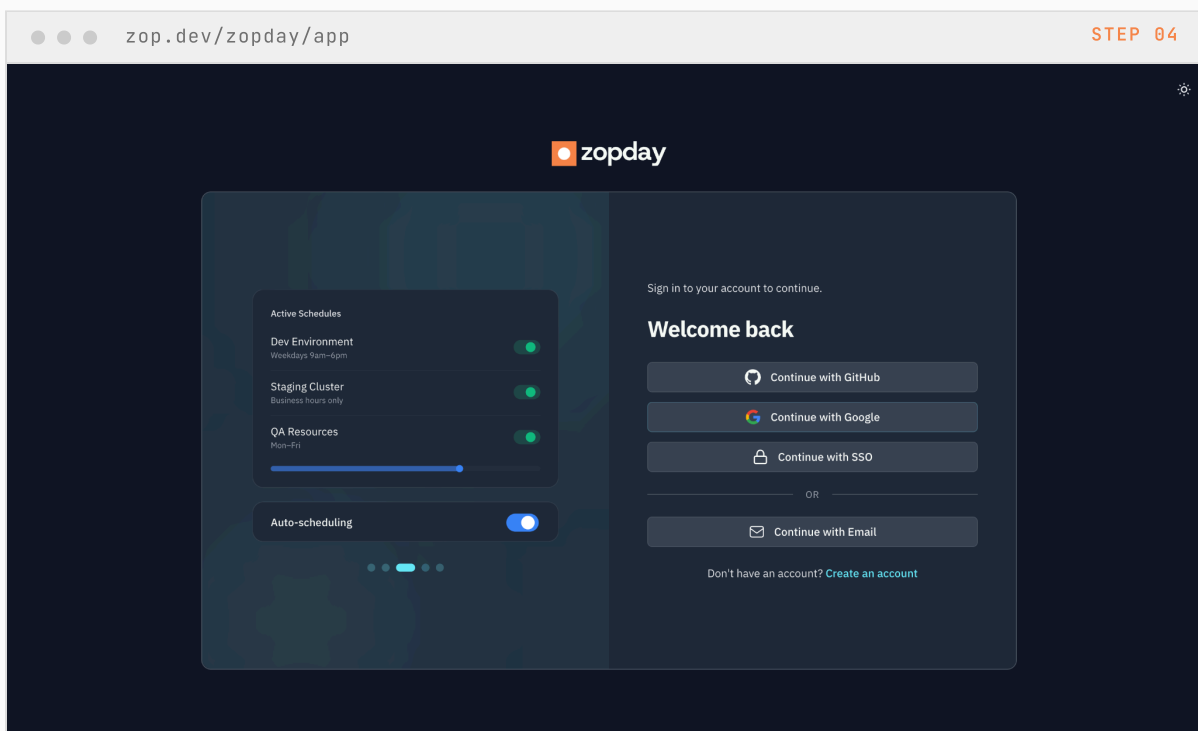

ZopDay is the one that deploys apps. Click the orange card.

04

Log in

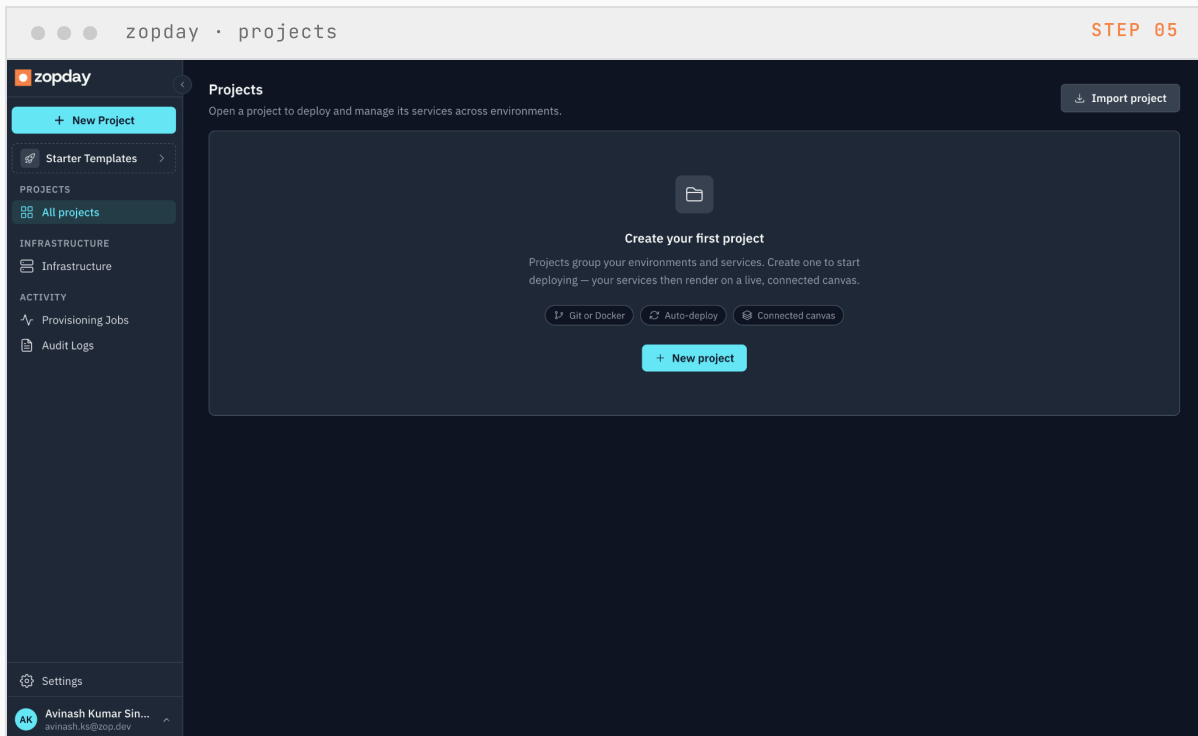

Pick any option. Here we use **Continue with Google**.

05

Click “+ New Project”

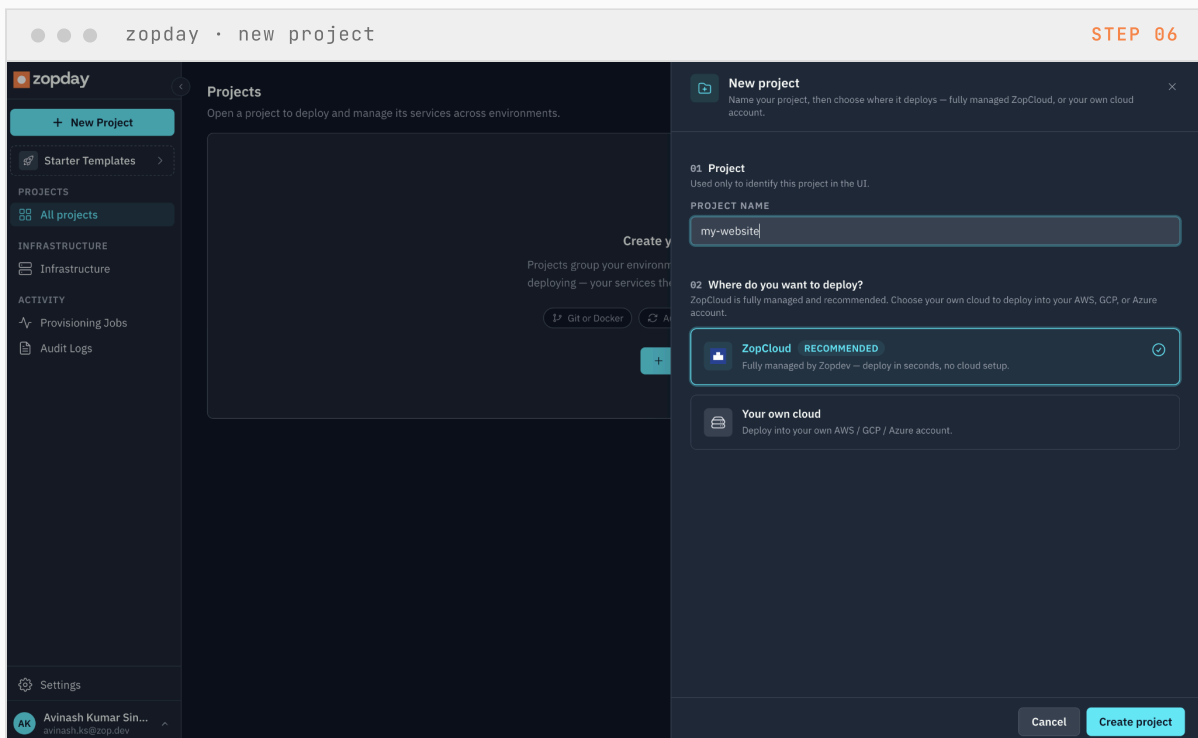

A project is a folder for your app. The button is in the sidebar and in the middle of the page.

06

Name it and click “Create project”

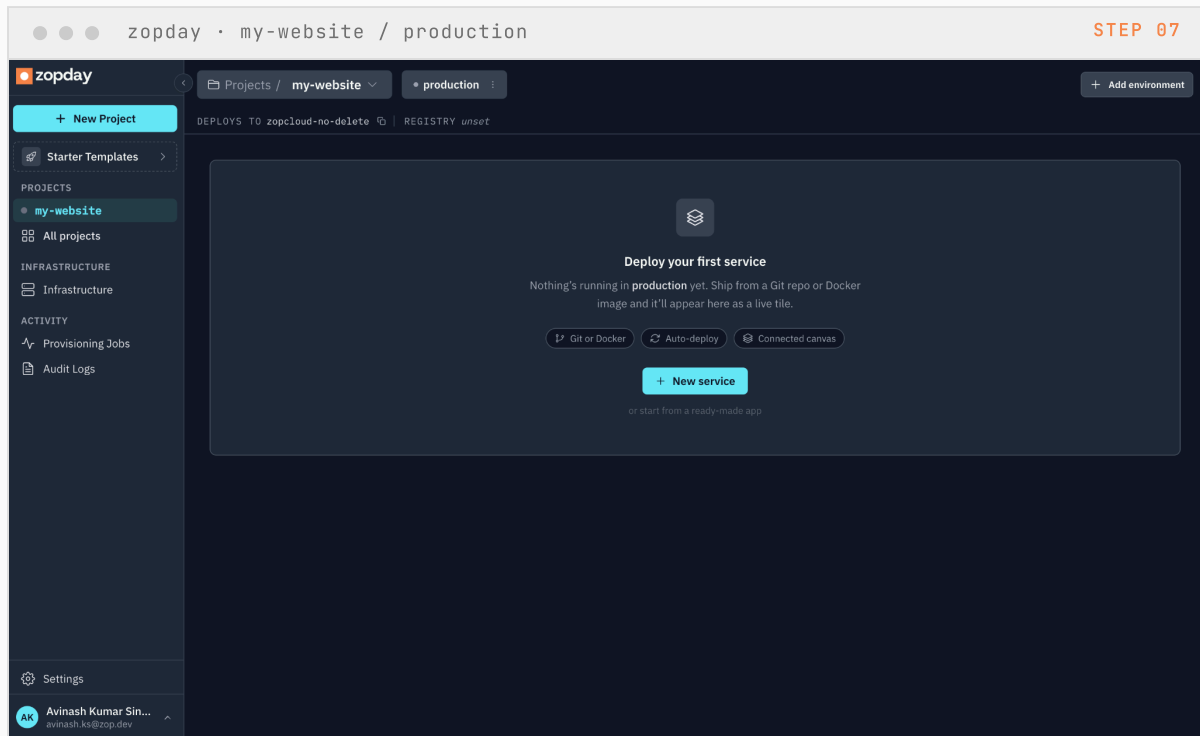

Type a name like `my-website`. Leave **ZopCloud** selected. It means ZopDay handles all the servers for you.

07

Click “+ New service”

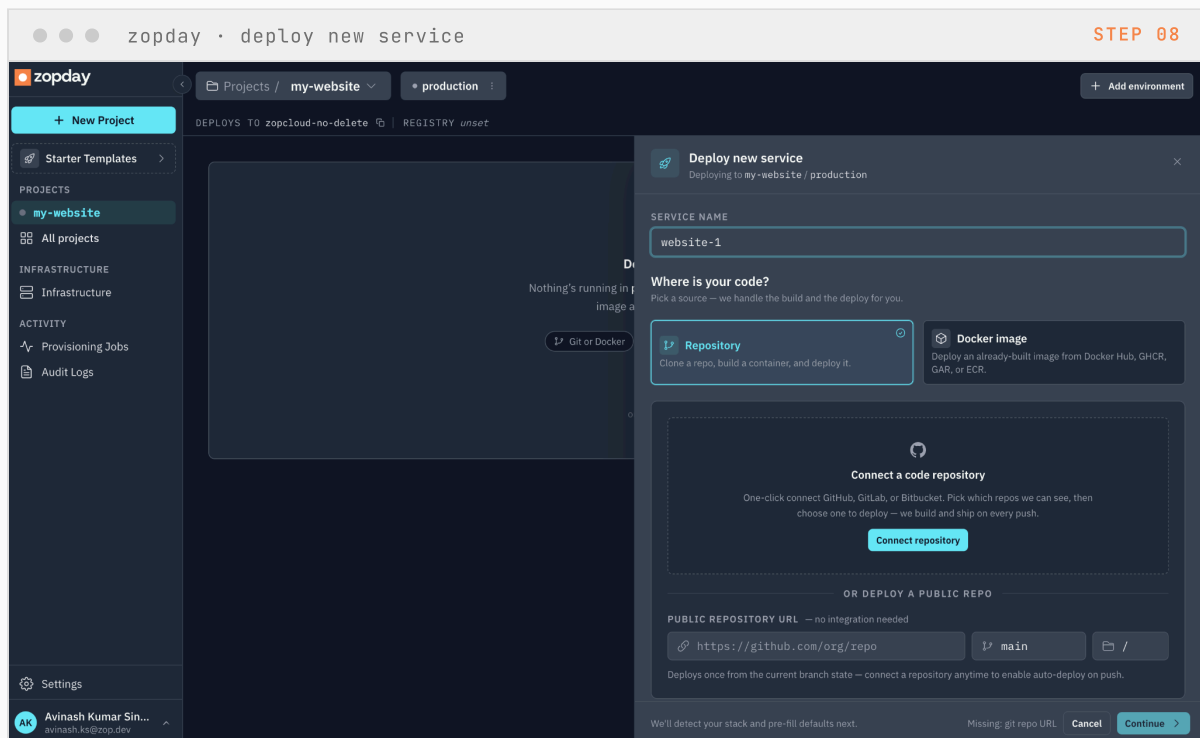

A service is your running app. You are inside your new project now.

08

Name it and keep “Repository”

Type a name like `website-1`. Repository means ZopDay takes your code from GitHub and builds it for you.

09

Is your repo public? Paste the link here

Put its GitHub link in the **Public repository URL** box, then jump straight to step 14. Private repo? Ignore this box and do step 10.

OR DEPLOY A PUBLIC REPO

PUBLIC REPOSITORY URL — no integration needed

 https://github.com/org/repo

 main

 /

Deploys once from the current branch state — connect a repository anytime to enable auto-deploy on push.

10

Private repo? Click “Connect repository”

This links your GitHub to ZopDay. You only do it once. As a bonus, your app updates itself every time you push new code.

Connect a code repository

One-click connect GitHub, GitLab, or Bitbucket. Pick which repos we can see, then choose one to deploy — we build and ship on every push.

Connect repository

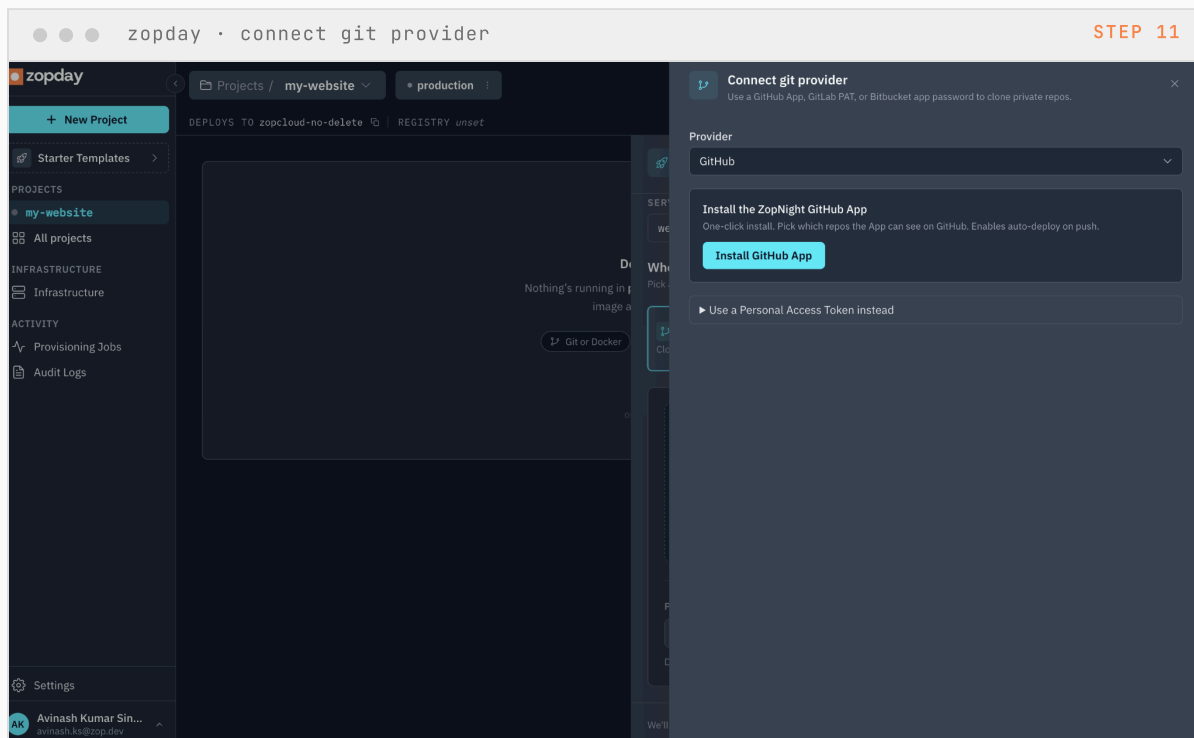

Which one should I pick?

Paste the link if you just want to try it fast. Connect GitHub if this is your real app: connected repos redeploy on every push.

11

Click “Install GitHub App”

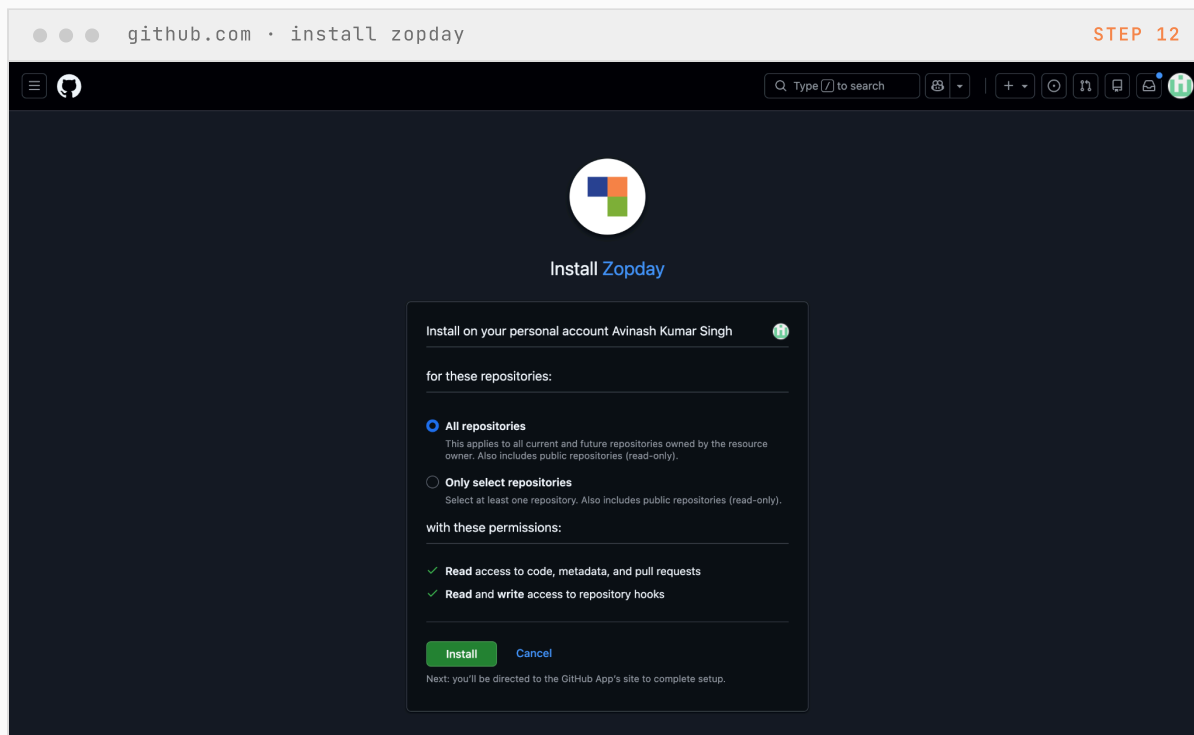

Keep GitHub as the provider and click the blue button.

12

On GitHub, click “Install”

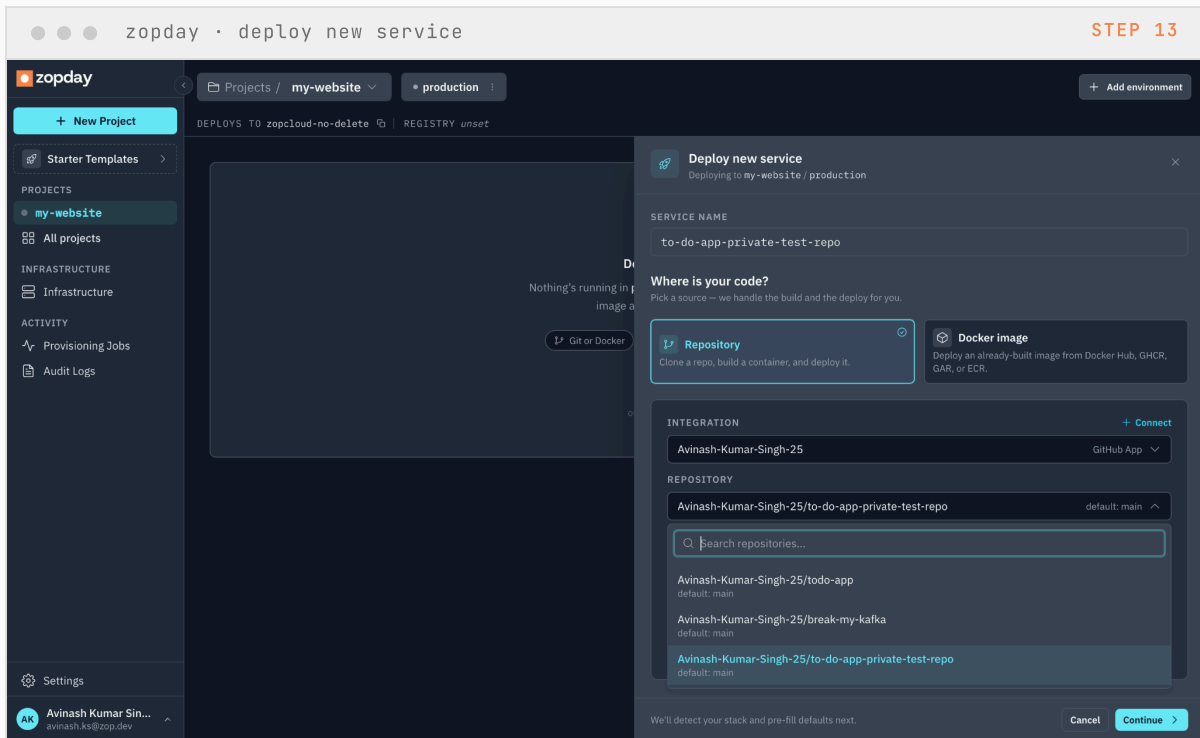

Keep **All repositories** selected. This lets ZopDay see your code.

13

Pick your repo, click “Continue”

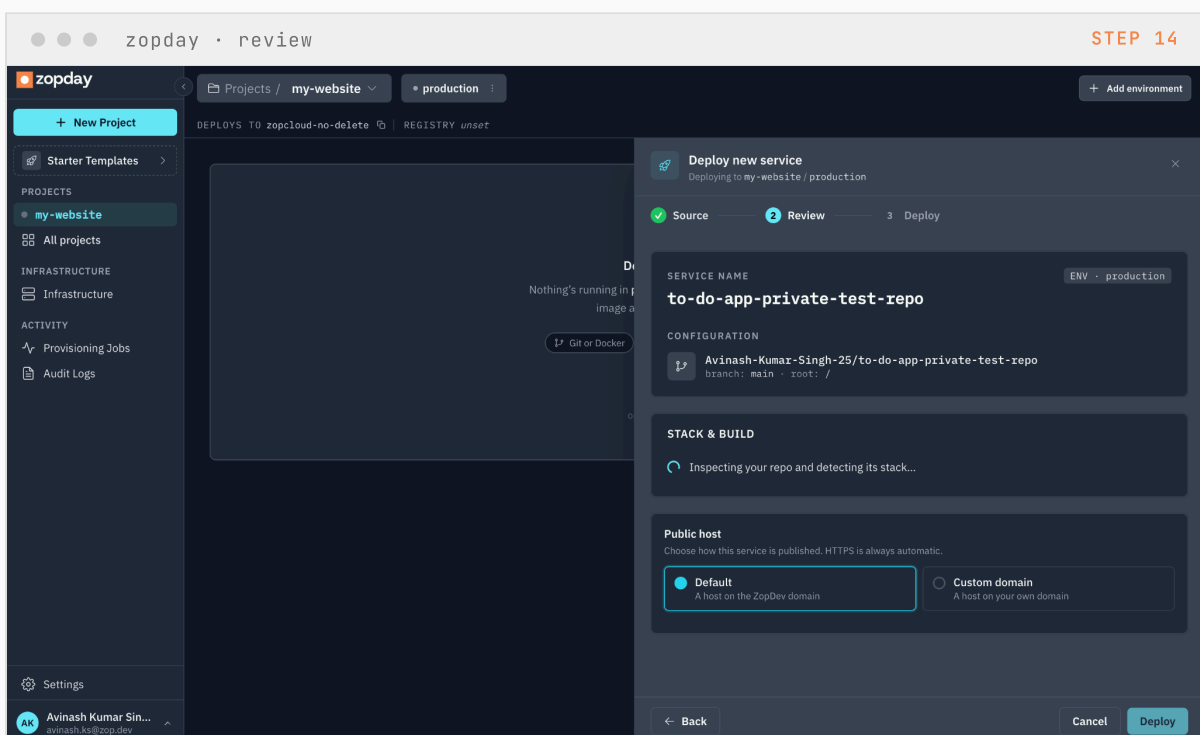

Back in ZopDay, open the dropdown and choose the repo you want to put online.

14

Click “Deploy”

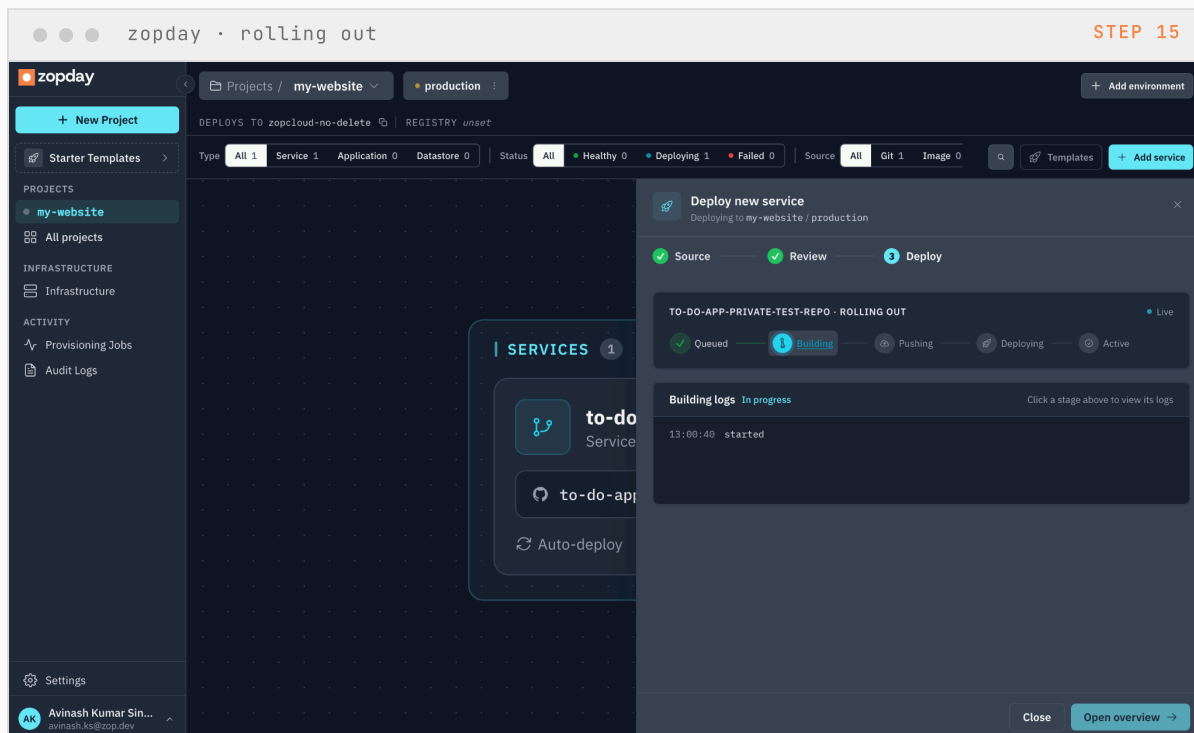

ZopDay looks at your code and fills in the settings by itself. Leave **Default** selected so you get a free web address.

15

Wait a few minutes

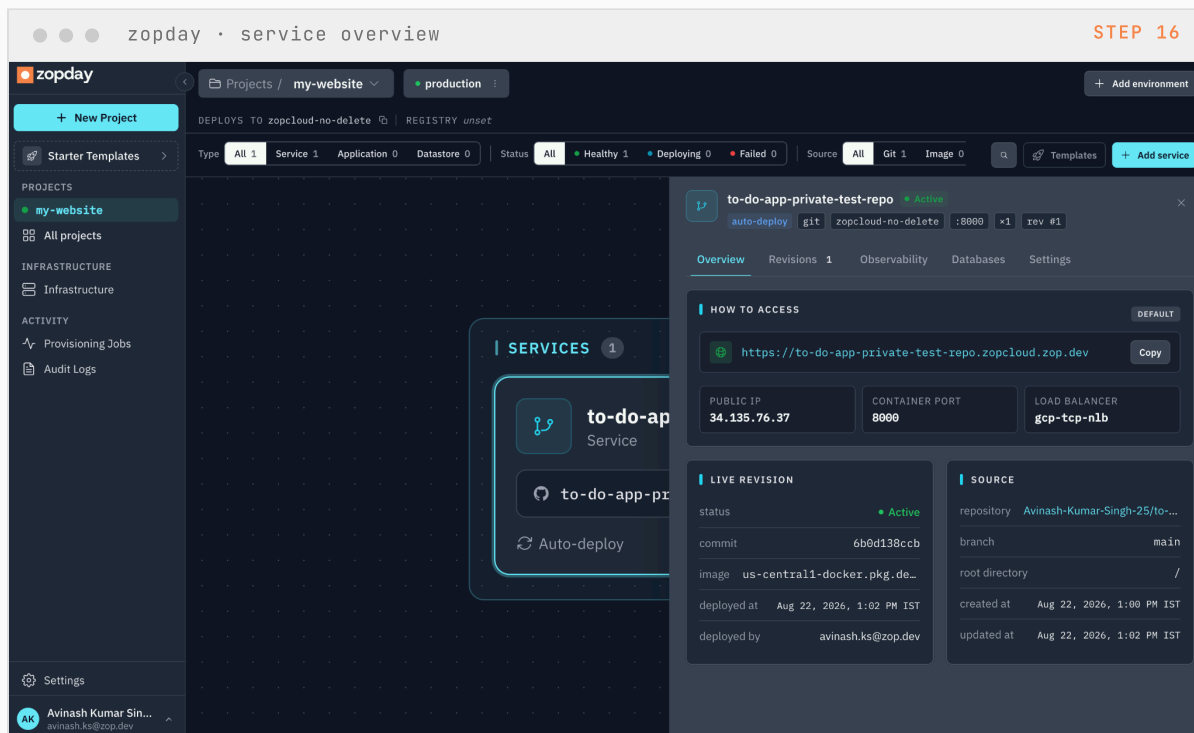

You can watch it move: `Queued` `Building` `Pushing` `Deploying` `Active`. Grab a coffee.

16

Open your link

Click **Overview**. Your web address is at the top, under "How to access". Click it. That is your app, live on the internet.

That's it. You're live.

Share the link with anyone. It works on any phone or laptop,
anywhere.
